

Phantom: Solana's default consumer wallet

PROBLEM & USERS

- **Problem:** self-custody is hard: keys, token accounts, fees, scams.
- **Users:** retail traders (memecoins, NFTs, DeFi) and dApps that need a wallet their users already have.
- **Why Solana:** sub-cent fees and ~400 ms blocks make frequent swaps and transfers cheap and instant; SPL standards let one wallet support every token.
- **Competitors:** Solflare, Backpack, Jupiter Mobile, MetaMask, embedded wallets (Privy, Dynamic).

peak monthly active users
(Phantom)

0.85%

fee on most in-app swaps:
the main revenue source

BUSINESS MODEL

Free wallet; money comes from **transaction flow**: swap and bridge fees, on-ramp referrals, newer finance products.

Standard programs on-chain, the value is off-chain

ON-CHAIN

- No custom core program: composes public programs
- Balances, token accounts, every signed instruction

PROGRAMS USED

System 1111...

SPL Token Tokenke...

Token-2022 Tokenz...

ATA ATokenGP...

ComputeBudget...

Jupiter v6 JUP6Lk...

SWAP TX PATTERN

v0 tx + 4 lookup tables → Jupiter RouteV2 → TransferChecked; separate fee payer = "gasless"

OFF-CHAIN

- Key generation & encrypted storage (on device)
- **Transaction simulation** & scam blocking
- Own RPC, indexer, prices, history
- Swap-quote API, bridges, on-ramps
- SDKs: Phantom Connect, Wallet Standard

RISKS → IMPROVEMENTS

- **Drainers/phishing:** users sign what they don't understand → plain-language previews
- **Centralised backend** (RPC, indexer) is a single point of failure
- **Seed-phrase loss** is still #1 → trusted, verified recipients
- **English-first, screen-first UX** → native language & voice

Takeaway: any wallet can use the same programs, so the competition is **UX and safety**. Native-language, voice-first UX on top of existing wallets is the open gap (what Mzia fills).
